

Are you eligible for the **Galleri**® test?

Multi-cancer early detection

The Galleri® test detects a cancer signal across more than 50 types of cancer, many of which are not commonly screened for today, through a simple blood draw.¹⁻³ If a cancer signal is found, the results can point to where in the body the cancer is coming from to help your healthcare provider guide your next steps.

Illumina employees and their dependents in the US continue to have access to the Galleri® test at no cost on an annual basis if the following clinical eligibility criteria are met:

- You are age 50 or over; *OR*
- You are between Age 22-49, *AND*:
 - You have a history of cancer (excluding basal or squamous cell carcinomas of the skin) and are 3+ years out of treatment;
 - You have a first-degree relative (parent, child and/or full sibling) who has had cancer;
 - You are a smoker or have quit smoking in the last 10 years; or
 - You had previous genetic testing and were found to have a gene mutation confirming an increased cancer risk due to a hereditary cancer syndrome (e.g., BRCA1/2, Lynch syndrome, CHEK2). Please note that a clinical report from an accredited laboratory that performs clinical grade genetic testing is required; this excludes tests from 23andMe, Ancestry.com and other direct-to-consumer genetic testing companies. A consultation with a genetic counselor is required if you have had a previous gene mutation in order to confirm the finding.

To take advantage of this benefit:

- 1) Visit [Genome Medical](#) to review program details and request the test.
- 2) If you are eligible for the benefit based on the clinical criteria, Genome Medical will order the test to be shipped to your home address.

Annual eligibility for the test is on a rolling calendar year basis from the date your results are reported to you. Genome Medical will notify you when you are eligible to request the test again.

Important Safety Information:

The Galleri® test is recommended for use in adults with an elevated risk for cancer, such as those aged 50 or older. The Galleri® test does not detect all cancers and should be used in addition to routine cancer screening tests recommended by a healthcare provider. Galleri® is intended to detect cancer signals and predict where in the body the cancer signal is located. Use of Galleri® is not recommended in individuals who are pregnant, 21 years old or younger, or undergoing active cancer treatment.

Results should be interpreted by a healthcare provider in the context of medical history, clinical signs and symptoms. A test result of No Cancer Signal Detected does not rule out cancer. A test result of Cancer Signal Detected requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer.

If cancer is not confirmed with further testing, it could mean that cancer is not present or testing was insufficient to detect cancer, including due to the cancer being located in a different part of the body. False-positive (a cancer signal detected when cancer is not present) and false-negative (a cancer signal not detected when cancer is present) test results do occur.
